Asthma Slide Show Pictures Take the Asthma Quiz! Asthma Myths and Facts What is albuterol and ipratropium inhaler, and how does it work (action mechanism)? Albuterol/ipratropium is a combined product consisting of two broncholytic agents, albuterol (Proventil; Ventolin) and ipratropium (Atrovent), which is used in the treatment of chronic obstructive pulmonary disease (bronchitis and emphysema) when there are signs of spasm (constriction) of the airways (bronchospasm). Broncholytics expand or enlarge the airways, relaxing the muscles surrounding the airways. Albuterol and ipratropium work under different mechanisms, but both cause the muscles of the airways to relax. Albuterol is a broncholytic of beta-2 agonist type. Beta-2 agonists are medications that stimulate beta-2 receptors on smooth muscle cells that align the airways, causing these muscle cells to relax and thus opening the airways. Ipratropium blocks the action of acetylcholine in the airways and nasal passages. Acetylcholine is a chemical that nerves use to communicate with muscle cells. In chronic obstructive pulmonary disease (COPD), cholinergic nerves, often in the lungs, cause narrowing of the airways, stimulating the muscles of the surrounding airways to contract. The anticholinergic effect of ipratropium blocks the action of cholinergic nerves, causing the muscles to relax and the airways to expand. In October 1996, the FDA approved albuterol/ipratropium. Which brands are available for albuterol and ipratropium inhaler? Combivent Respimat albuterol and ipratropium inhaler available as a generic drug? Yes, I need a prescription for albuterol and an inhaler, Ipratropium? Yes What is the use of albuterol and ipratropium inhaler? Albuterol and ipratropium inhaler (Combivent Respimat) are prescribed to treat bronchospasm or airway narrowing caused by emphysema or bronchitis in people who require a second bronchodilator. What are the side effects of albuterol and ipratropium inhaler? Side effects of albuterol/ipratropium combined products due to drug components. Side effects of albuterol include nervousness, tremor, headache, rapid heartbeat, high blood pressure, nausea, dizziness, and heartburn. Throat irritation and nosebleeds can also occur. The development of diabetes and the decline in potassium were also reported. The most common side effects associated with ipratropium are: dry mouth, cough, headache, nausea, dizziness, and shortness of breath. Due to the anticholinergic effect, ipratropium can worsen symptoms of benign prostatic hyperplasia, and narrow-angle glaucoma. Other important side effects include allergic reactions that may occur infrequently and can manifest as: rash, hives, swelling, or anaphylaxis (shock). In rare patients, albuterol/ipratropium can paradoxically precipitate life-threatening bronchospasm. What is the dosage of the inhaler of albuterol and ipratropium? Recommended dosage for albuterol/ipratropium is 2-2.4 times a day and if necessary do not exceed 12 inhalations per day. The combivent Respimat dose is 1 inhalation 4 times a day, so as not to exceed 6 inhalations per day. What is asthma? Asthma Myths Debunked See Slide Show What Drugs or Supplements Interact With Albuterol and Ipratropium Inhaler? The use of other anticholinergic drugs (e.g. atropine) can increase the occurrence of side effects. Tricyclic antidepressants such as amitriptyline (Elavil, Endep), monoamine oxidase inhibitors such as tranylcypromine should not be combined with albuterol/ipratropium due to their additive effects on the vascular system (high blood pressure, pulse, etc.). Between treatment with albuterol/ipratropium and tricyclic antidepressants or monoamine oxidase inhibitors should be a two-week period. The use of albuterol/ipratropium with other stimulant drugs is not recommended due to their combined effects on heart rate, blood pressure, and the potential for causing chest pain in patients with underlying coronary heart disease. Beta blockers, such as propranolol (Inderal, Inderal LA) block the action of albuterol and can cause bronchospasm in asthmatics. Albuterol/ipratropium can cause hypokalemia (low potassium). Therefore, a combination of albuterol/ipratropium with diuretics that reduce potassium in the body, such as furosemide (Lasix) can increase the likelihood of hypokalemia. Is a albuterol and ipratropium inhaler safe to take if I am pregnant or breastfeeding? There are no adequate studies of albuterol/ipratropium use during pregnancy. Some reports indicate that beta agonists may interfere with the contraction of the uterus. It is not known whether albuterol/ipratropium is excreted in human milk. What else should I know about albuterol and ipratropium inhaler? What drugs are albuterol and ipratropium inhaler available? Aerosol inhaler: 90/18 micrograms or 100/20 micrograms (albuterol/ipratropium) to activate the inhaler. How to keep the inhaler albuterol and ipratropium? The inhaler should be stored at room temperature, 15 C - 30 C (59 F - 86 F) and stay away from moisture. The DuoNeb brand was discontinued in the United States. If generic versions of this product have been approved by the FDA, there may be common equivalents available. What is DuoNeb? DuoNeb is a sterile inhalation solution containing a combination of albuterol and ipratropium. Albuterol and ipratropium are bronchodilators that relax the muscles of the airways and increase the flow of air into the lungs. DuoNeb inhalation solution is used to prevent bronchospasm in people with chronic obstructive pulmonary disease (COPD), who also use other medications to control their condition. DuoNeb can also be used for purposes not listed in this medication guide. Important information Seek medical help if you think DuoNeb inhalation solution does not work as well as usual. Excessive use of albuterol and ipratropium can increase the risk of death. It is very important that you only use the prescribed dose of this medication. Before using DuoNeb, tell your doctor if you have heart disease, high blood pressure, coronary heart disease, heart rhythm disorder, convulsions, diabetes, thyroid hyperactivity, glaucoma, enlarged prostate, urination problems, liver disease, or kidney disease. You should not use DuoNeb if you are allergic to albuterol (Proventil, Ventolin), ipratropium (Atrovent), or atropine (Atreza, Lomotil, Vi-Astro, Sal-Tropine). Before taking this medication, you should not use DuoNeb if you are allergic to albuterol (Proventil, Ventolin), and Peratropine (Atrovent), or atropine. To make sure duoNeb is safe for you, tell your doctor if you've ever had: heart disease, high blood pressure, coronary heart disease, or heart rhythm disorder; seizure disorders such as epilepsy; Diabetes; Hyperactive thyroid; glaucoma; Liver or kidney disease; or enlarged prostate, problems with it is not known whether DuoNeb will harm the unborn child. Tell your doctor if you are pregnant or planning to get pregnant. Albuterol and ipratropium inhalation can pass into breast milk and can harm nursing babies. You have to breastfeeding when using this medication. DuoNeb is not approved for use by anyone under the age of 18. How to use DuoNeb? Use DuoNeb exactly as prescribed by your doctor. Follow the instructions on the recipe label. Do not use this medicine in larger or smaller quantities or longer than recommended. DuoNeb is usually used 4 times a day. Follow the doctor's instructions on suction very carefully. Excessive use of albuterol and ipratropium can increase the risk of death. It is very important that you only use the prescribed dose of this medication. DuoNeb inhalation comes with patient instructions for safe and effective use, and directions for priming the inhaler device. Follow these instructions carefully. Ask your doctor or pharmacist if you have any questions. To use DuoNeb inhalation solution: Open the foil bag and remove one vial. Squeeze all the medicine into the nebulizer's cell. Attach a mouthpiece or face mask, then attach the drug's camera to the compressor. Sit upright in a comfortable position. Place the mouthpiece in your mouth or apply a face mask covering your nose and mouth. Turn on the compressor. Breathe slowly and evenly until no more mist is formed from the nebulizer and the camera is empty. Clean the nebulizer after each use. Follow the cleaning instructions that came with the nebulizer. Use this medication regularly to get great benefit. Get your prescription replenished before you run out of medicine completely. Seek medical attention if you think this medication is not working as well as usual. If you use DuoNeb, you may need a medical examination. Store at room temperature away from moisture, heat and light. Store each Duoneb bottle in a foil bag until you are ready to use it. Do not keep Combivent Respimat in the car on hot days. Extreme heat can cause the canister of medicine to burst. Do not throw an empty canister into the open flame. DuoNeb dosing information The usual dose for adults for chronic obstructive pulmonary disease - Service: DuoNeb inhalation solution: One 3 ml vial by nebulization 4 times a day with up to 2 additional 3 ml doses allowed per day Maximum recommended dose of 6 vials (18 ml/day). What happens if I miss a dose? Use the missed dose as soon as you remember. Skip the missed dose if it is almost time for the next scheduled dose. Do not use

additional medications to make the missed dose. Do not use more than 6 inhalations over a 24-hour period. What happens if I overdose? Seek emergency medical attention or call 1-800-222-1222. Overdose of albuterol and ipratropium can be fatal. Overdose symptoms may include chest pain, rapid or pounding heartbeat, tremor, dry mouth, thirst, muscle weakness or sluggish feeling, severe headache, pounding in the neck or ears, or feeling like you might side ways. What should I avoid when using DuoNeb? If this medicine gets into the eyes, rinse with water and seek medical attention. This medication can cause blurred vision or impair your thinking or reactions. Be careful if you drive or do whatever requires you to be vigilant and able to see clearly. Get emergency medical attention if you have signs of an allergic reaction to DuoNeb: hives; shortness of breath; swelling of the face, lips, tongue or throat. Call your doctor right away if you have: wheezing, choking, or other breathing problems after using DuoNeb; Chest pain; fast or pounding the heartbeat fluttering in the chest; tremor, nervousness; swelling of the ankles or legs; blurred vision, tunnel vision, eye pain, or seeing halos around lights; painful or difficult urination; or low potassium - leg cramps, constipation, irregular heartbeat, trembling in the chest, increased thirst or urination, numbness or tingling, muscle weakness or sluggish feeling. Common DuoNeb side effects may include: headache; Breathing problems; or cold symptoms such as stuffy nose, sneezing, coughing, or sore throat. This is not a complete list of side effects and others may occur. Call your doctor for medical advice about side effects. You can report FDA side effects at 1-800-FDA-1088. What other drugs will affect DuoNeb? Tell your doctor about all your current medications and anyone you start or discontinue use, especially: diuretic or water tablets; a cure for heart or blood pressure; Other beta-blockers; Or an antidepressant. This list is not complete. Other drugs may interact with albuterol and ipratropium, including prescription and over-the-counter medications, vitamins and plant foods. Not all possible interactions are listed in this medication guide. More information Remember to keep this and all other medications within reach of children, never share your medications with others, and use DuoNeb just for indication prescribed. Always consult your health care provider to make sure that the information on this page is relevant to your personal circumstances. Copyright 1996-2020 Cherner Maltum, Inc.
