Jupiterimages/Photos.com/Getty Images The Nissan Pathfinder is one of the original compact sports-useful cars, and as such, there are many aftermarket options available. If you want to install a new stereo system, add power windows or maybe just change the power lock system, you need to remove the door panels. In this case, design the vehicle 1994 Nissan Pathfinder, but the process is similar to other vehicles as well. Open the door and unscrew the doorbar with a screwdriver with Phillips' head. There are screws behind the door handle, as well as under the armrest. Pull the power window switches and turn off the harness from the switches. Place the tool removing the inner clip between the doorbar and the door body, and pull it back to free the clips from the door. There are six clips holding the panel in place. Pull off the triangular shape of the inner panel, which is opposite the mirror, using your hands to release the clips and then place it to the side. Lift the door panel vertically from the door assembly and place it to the side. Phillips-head screwdriver/interior clip removal tool Have you ever wondered what it is to be a chemist? Here, real chemists share their experience, including the pros and cons of working in chemistry. I asked chemists to answer the following career questions so that someone would think about becoming a chemist, to make an informed decision. What chemical are you? What do you do as a chemist? What is the best/worst part of your work? What kind of training did you need? Was it easy to find a chemist's job? Are you happy to be a chemist? Why? What advice would you give to someone who is interested in a chemist? Keep in mind that some respondents are from non-English speaking countries. The survey was conducted in 2014. Here are their answers: I'm from a top 5 Chinese university and I did an internship in my senior year. I'm an intern of fusion. From what I've learned, there are a lot of jobs in the market, a lot of new pharmaceutical companies. But the problem is that the payment is very low (3k ZANY in Nanjing, too low to survive in the city, but the company is in a poor area of the city, the standard of living is low) and the working conditions are very poor, and working hours are long. One member of the group left the company for health reasons, his dock warned. Then I applied to school in the United States. It's nice to study on board with a scholarship, but it's not enough to live in the city. It seems that chem work in the US is impossible and I certainly don't want to go back porcelain to work in chem work. So I'm thinking about changing my specialty to biostatistics, CS or business. really struggling now. -ChineseStudent So many chemistry jobs are low-paid contract positions without security jobs. Most chemistry majors do not work in the laboratory or even in science. These are managers, sellers, regulators, etc. work in the lab and no one will hire you and and too old now about 35 years old. Sometimes even younger. Or you have low-paid new graduates like lab technicians to do all the actual lab work while you sit in meetings all day and work 60 hours in it. And businesses are all about profit and market share, not actual NIOCRIT or science. It's sadly sad. - Unemployed/part-time I graduated from university with Bsc in Chemistry in 2013. After four months, I was able to find a job, although not a good salary, but I still want to continue working with chemistry because I work as an oil officer. I am looking forward to developing my career in chemistry as I aspire to be a chemical engineer. -Suleiman Kamara I studied for 8 years in a row only to find that there are absolutely no work anywhere. I have applied for a job as a chemist for the last 3 years and have found nothing, I am still indebted to school loans and wonder why I ever went into this field. I now work 2 jobs, one in a King's burger and the other a shovel dog sms in the nursery. I cry myself to sleep most nights. -My life ended my suggestion to no one want to get into this area IS STAY AWAY from chemistry. I graduated with MS in Chemistry back in 2007 and worked for several chemical and pharmaceutical companies. I can tell you that 90% of the people I have worked with, including I regretted going into this field and I have not yet met a person who loves to work with chemicals. Chemistry is oversaturated and underpaid. As a chemist-analyst you will get about 30K to 45K. If you have a doctorate and don't mind risking your life to work with explosive chemical reactions, then you can get 45K to 70K. The reality is that there are just too many candidates available in the job market and many of them are PhDs. There is no job security in this area. Many large companies have already moved their RD and production facilities to Asia, and they rarely offer a Permian position in technical positions. I've seen too many people ordered to leave the company without a minute's notice because they are on contract. - Peter L I recently received a doctorate in organic chemistry (top 35 schools). I had to work very hard for a long time including a one year industrial document post. Now I work in the same company with a chemist-process, synthesizing active pharmaceutical ingredients. The fee is 80,000 and I love my job. It was very difficult to find a job after my doctorate and I sent resumes all over the country. I love my job now and have even received calls from recruiters for other jobs. I think the job market is competitive and supply is greater than the demand at the BS/MS level. to graduate school. I think if you work as a chemist, you get a doctorate. Work is more interesting and pay better. Also, there are so many BS/MS chemists one of the best ways to beat competitors is to get a PhD BS/MS chemists to use to have more opportunities to advance, but now the job market seems saturated with them. Them. Chemist I love chemistry. It's really fun and complicated, but only in terms of theories... work in the lab sucks! long hours sometimes until midnight depends on the experiment ... Underpaid... But that's not the main concern... I understand that my health is deteriorating significantly... Lab work makes me dizzy. -K As a synthetic organic chemist with a doctoral thesis, 4 patents and a bunch of papers, 15 years of research, I am now a self-employed cleaner in Melbourne, Australia. If I had graduated from the pharmacy, instead of doing my PhD, and wasting my time in medical chemistry I would have been working now with at least some chemistry. -Ada I got a job working in a chemical lab, an entry-level research fellow, earlier this year. Just got a pink slip and said my last day is May 28th. I graduated in 2008 and I went through a number of odd jobs, low-paid gigs, just to get through. Chemistry is the worst degree you can get, so much time and effort spent in class for nothing. If I knew I was unemployed doing science, I'd be easier and study business instead. All these students running around blogging about the wonderful potential of career chemistry, the parrot of corporate propaganda is very annoying. I hope that young chemists laugh at the mistakes of old chemists and approach career choices in a different way. - Unemployed chemist Anyone who is still a student is not allowed to talk about the state of the industry. You don't know what it's like, so stop acting like you. We all liked chemistry in our years, but the reality of chemistry is quite different. You all think it's fun and challenging when your experiments don't work because you're learning. If someone pays for your research and you are under pressure to perform, it is not a pleasure to fail. You spend most of your time writing grants, reading documents and getting up. When you don't, you're dealing with idealistic students telling you: Chemistry for smart smart people - there's no limit to what you can do! Education, skills and ambition. Use it. You don't know, so shut up. I can't wait until you get to the real world and back your head posing the same stuff as everyone else. -Be a calm student I graduated with BS in Chemistry with 3.89 gpa in 2010. I struggled to find a job. Everyone said I didn't have enough experience. I only had one interview, and I was lucky that they offered it to me when I left the interview. I made 51K last year. My company just bought a lab abroad in India. They open a lab that does the same thing we do, but the cost will be 1/3 of ours. In the fall, I applied for an MBA. Although I love science and chemistry, I just don't think there's a future in the US for that. -wochemist I'm a recent with a bachelor's degree in chemistry. Unlike most, I was lucky to have worked in a commercial analytical lab in the summer. It was miserable, no one seemed to themselves and many were looking for other ways to find employment. I personally fought him myself. It had about 20 staff, 10 of whom I still have great friends with these ten-five stayed and five returned to school for something unrelated or medical professions. I myself saw job prospects early and refused, after discussions with my family I decided to go back and do my MBA I start in about a month and a half and my job prospects look infinitely greater. I already had a family friend offer me a well-paid position after graduation. For all those who assume that it is easy to find a job, it is not. Chemistry is just a stepping stone, and I would never advocate getting a degree in chemistry and dwell on that. Many of my friends who also finish follow my route. - Donewiththem I am a fairly recent graduate (2010) with a bachelor's degree in chemistry. I can't find a job in chemistry to save my life, despite having been trying constantly for the last two years. I have a job as a radiation control specialist at a naval shipyard that pays decently and is a stable job, but I'd rather work as a chemist. I love science and I don't care about money, and chemistry is a great area. It breaks my heart to read all these messages from people working as laboratory technicians whining about low wages and poor job security. I'll do anything to be in their shoes! Either way, I think what I'm trying to say is advice-wise: don't go into chemistry if you're out to make money because there's no need to be done. - As an aspiring chemist I finished my doctorate recently and am now in a post-doctoral position. Also, I am in Australia and I notice that in this place we tend to pay significantly more like Postdocs than in many other countries such as the US. I thoroughly enjoyed the whole process of researching and putting together journal articles for publication. I can understand that for those in industrial conditions, the labor market can be particularly volatile. The situation in academia is not much better if you are not able to come up with new research and devote the time it takes to put out high degree exposure articles. However, personally I like intellectual stimulation and I will try to do as much as I can as long as I can. -OxathiazoleChemist BS BIOCHEMISTRY 1968, NO JOB OFFERS SO WENT TO GRAD SCHOOL, THEN NO JOB SO WENT TO MED SCHOOL... MANY DOCTORS WERE CHEMISTS, OR BIOCHEMISTS, THERE ARE NO JOBS, SO MEDICINE IS A GOOD END POINT FOR A CHEMIST... TRY ALSO TO GET PRE-MED COURSES DONE AS PRE-ASKED. MY DAD WAS ALSO A BS BERKELEY CHEMIST, EVENTUALLY WORKING IN THE STATE OF CALIFORNIA TO REGULATE WATER POLLUTION... SO CHEMISTRY IS ONLY THE FIRST STEP, THE LAST CAREER IS SOMEWHAT DIFFERENT, BUT THE CHEMISTRY BACKGROUND ALLOWS YOUR ABILITY TO ENTER ANOTHER AREA. BEST OF LUCK, ROBIN TRUMBULL, MD -DRTRUMBULL. I have BSc awards in physical chemistry. After struggling to get a job in this field, I eventually found a writing job and science high school resources. I love my job and get a good salary. Yes, the labor market sucks, and it's a harsh environment, but if you like it, stick to it. So my advice is to consider other things that use your knowledge. And I urge all promising chemists to learn about technology and learn to program or specialize in computer science and chemistry. This really expands the field of your possible work. Chemistry is not dead, we just need to get on with the program and adapt to the brave new world of technology. There is much more we can still do with this incredible and fascinating area, but we have to recognize that technology is part of it now. -Heather Just another vote to add to the chorus with a mid-career candidate. If you are interested in chemistry and it is your passion, by all means pursue it as a hobby. But don't expect to make a career out of it, gain respect, and/or provide adequately and steadily for the family. Forget it! I have Bsc in Chemistry and still can't find a decent job, if I knew better, I would never major in chemistry. -Irritated chemist quality and quality assurance chemist of the last 20 years. I work in petrochemical companies as technical consultants, as well as in complex laboratories. -Mohammed Iqbal I finished last year with BS in Chemistry with 3.8 GPA, and so far for a year in a row I was looking for a decent job that pays more than my current job. So far it doesn't go... get upset, and might just come back and get a doctorate in chemical engineering. With student loan companies wanting their money, and no jobs to be found, this is about my only choice. - Afid I am a chemist. I have a bachelor's and master's degree with a dissertation in one of the best schools in this country (consistently takes #1 on the master's program). I worked for a multinational corporation, and I can tell you that chemistry is dead. If you are in school, study engineering or computer science. Don't waste your time. People don't appreciate chemistry. Value on engineering or computer programming. The era of materials and chemical research on a scale to support new graduates or middle-aged people is over. I've been fired two or three times and it's with awards, patents, publications, etc. from these companies. The bottom line is that it's all about applied science (engineering) or computers (programming). I have over 5 years of experience and I would like to tell you not to do so. It's wasteful. - I wish I knew better Well, as in 2012 I can say that I actually offered a job, however they paid about 35-40K per year. On the other hand, my part-time job that I as a student pays me now as a full-time 50-55k factory (last year I did 50k and worked only 9 months). I was looking for a job that pay 50k and a steady day of hours, so far it's a failure. I don't know if I'll ever find a job like this. When I talk to my student student who work in chem it is clear that I am doing much better than they are. Don't go into chemistry, from what I hear high school is a waste of time for most people too. -2010 Graduate Hello, Chemistry is a very interesting subject to study. All branches of chemistry are more or less related to each other, so the more you know, the better you understand. As for jobs, it all depends on what one likes the most. Personally, I was fortunate enough to work in the marketing of chemicals in the industry. Here the sky is the limit because chemicals find use in many industries. Look at how many chemicals are used in the paint industry as an example. Mixing a scientific background with modern management practices is a formula for success. - a haddad I remind a student that there is a big difference between sitting in a classroom, being amazed by the possibilities of chemistry and actually trying to make a living from it. The negative comes from those in the field of APPLYING chemistry. Notice the title of this theme Job as a Chemist? We all loved our student years, but the simple fact is that the industrial chemistry profession in the U.S. actually declined by 2% according to the ACS. When you get a job, work for years, survive a wave of layoffs and get told that you've retrained for a lot of nothing out there, go back to the topic and let us know how you handled it all. Most of us were as optimistic about this profession as any student. Then we ended up in reality. -WorkingChemist I finished with my BS chemistry in 2007 started as a production chemist for about \$50,000. I decided to go back and get my MS chemistry while working (the employer paid most of it) and in 2011 I finished and took a new job as a process chemist for \$85,000. I love my job, it's fast paced and steady. I've seen very little turn around in chemists, but lab technicians come and go pretty quickly. Overall I would definitely recommend it as a profession. The only big drawback is there aren't many female chemists on the industrial side, and at any plant/refinery safety is always a small compromise. -MS Chemist Really I am very happy to say that I am a chemist. I have encountered so many problems to stand as a chemist in the field of chemicals. I think the chemistry is evergreen. -swathi I would like to post here just so that people can read, understand, and hopefully not make the same mistakes that I made. I graduated with a bachelor's degree in 2005, and even still struggle with permanent layoffs and unemployment. It's a really horrible economy out there for us chemists. I decided not to end my postgraduate studies because I just didn't have a passion for it. I worked low-paying jobs after work and gained a lot of work experience. In the beginning I thought I'd just work my way up, but 7 years later I am unemployed again after being fired. At every job I always thought high, wow you're the best tempo we've ever had but it doesn't matter I still go off and haven't been hired. Everything you do is not in chemistry, and if you're considering graduate school, if you can't get into one of the best, say, f it. I repeat, it's a career and a job. -ChemDude Could you add another losing chemist here? With a doctorate in polymer chemistry, as well as 2 years of postdoc. What I can do is short contract as a technician. By the way, I have no way to renew my membership in chemistry. -yoho It was a great punishment that God gave me. BSc chemistry. Chemistry! Chemistry!! -oli I have a bachelor's degree in chemistry and started my first job as a process chemist in 2005 to make \$42,000/year. In 2007-2010 I worked for the same company. I took a job at another company in 2011 and did the first ingredient training. For me, it consists of formulation, production of various mixtures, syntheses and some insignificant mechanical maintenance. Counting bonuses, I raised over \$70,000 in 2011. I worked under a doctoral thesis of chemists who make 6 figures a year. My short term goal at the moment is to get my MS into chemistry. I applied for the fall 2012 semester and found out my adoption status in May 2012. Obviously, because of the labor market, employment will be tough, but this is true for most types of jobs. Some people will find success, while others will not. It has to go, not to mention. -Chemist81 I have 15 years of experience in synthetic chemistry, including process development and drug chemistry. I have published and have numerous patents. Our chemistry department has been cut and outsourced. I now work as an analytical chemist, regarded as a slave to 2/3 that I used to do, in a job that is not intellectually stimulating in any way. I was lucky enough to get a job of any kind, synthetic jobs impossible to find unless you want to move to India or China. My former colleagues struggled to get interviews and are still unemployed. I agree with the poster that stated chemistry is dead in the US. -Former synthetic chemists are really smart, but businesses treat them like very smart fools. The person just saying chemists can get a job anywhere clearly has no idea how the job market works. The only way a chemist can switch careers is to go back to school, which is financially difficult or hide his degree and take a blue collar job. I passed the police exam because at the moment it would be a huge improvement. Many chemists, like me, are trapped and unable to escape the endless abuse and exploitation by companies that treat them worse than unskilled labor. -MSChemist There was no place here for all the answers submitted by the chemists, but I posted additional responses on my personal blog, so you can read them all and post your own opinion. Opinion. gun chemist pathfinder build
